## ENTERPRISE LEGAL PRACTICE MANAGEMENT

# Synology NAS On-Site Configuration & Field Guide

Target System: StillWorks LegalOS Enterprise Storage • Protocol: Synology WebDAV Server • Author: Implementation Team

This field guide provides an exact, step-by-step walkthrough for setting up an office Synology NAS as the secure document repository for StillWorks LegalOS during an on-site visit.

### Phase 1 Pre-Visit Preparation

- ☐ **Master Credentials:** Ask the managing partner or office manager who has the administrator password for the Synology NAS and office Wi-Fi router.
- ☐ **Diagnostic Laptop:** Your laptop with StillWorks LegalOS installed and web browser ready.
- ☐ **Network Cable:** Standard Cat6 Ethernet cable in case Wi-Fi is restricted.
- ☐ **Utility Tool:** Download free [Synology Assistant](#) on your laptop.

### Phase 2 Discover the NAS on the Office Network

1. Connect your laptop to the **office Wi-Fi or office network switch**.
2. Open your browser and navigate to:

```
http://find.synology.com
```

*(Or open Synology Assistant and click "Search".)*

3. Look for the entry showing:
  - **Model:** (e.g. DS220+ , DS920+ , DS423+ )
  - **IP Address:** (e.g. 192.168.1.50 or 192.168.0.120 )
  - **Status:** Ready
4. Click **Connect** or navigate to `http://<NAS_IP>:5000` .

### Phase 3 Set a Static (Permanent) IP

**Important:** If the router restarts, dynamic DHCP could assign a new IP address, breaking the document link. Setting a static IP prevents this.

1. Log into DSM (DiskStation Manager) using the master administrator credentials.
2. Open **Control Panel** → **Network** → **Network Interface**.
3. Select **LAN 1** and click **Edit**.
4. Select "**Use manual configuration**".
5. Keep the current IP Address, Subnet Mask, and Gateway. Set DNS Server to **1.1.1.1**.
6. Click **OK**.

#### Phase 4 **Install and Enable WebDAV Server**

1. Open **Package Center** from the DSM desktop.
2. Search for "**WebDAV Server**".
3. If not installed, click **Install**. If already installed, click **Open**.
4. In the configuration dialog:
  - Check **Enable HTTP** (Port: **5005** )
  - Check **Enable HTTPS** (Port: **5006** )
5. Click **Apply**.

## Phase 5 Create the Shared Folder for LegalOS

1. Open **Control Panel** → **Shared Folder**.
2. Click **Create** → **Create Shared Folder**.
3. Configure the folder:
  - **Name:** LegalOS
  - **Description:** StillWorks LegalOS Document Repository
  - **Location:** Volume 1 (or the primary storage pool)
4. Click **Next** through the wizard and click **Apply**.

## Phase 6 Create the Dedicated Service Account

**Security Best Practice:** Never use the master admin account inside the application. A dedicated service user isolates application access.

1. Open **Control Panel** → **User & Group**.
2. Click **Create** → **Create User**.
3. Set account details:
  - **Name:** legalos\_svc
  - **Password:** *(Create a strong 16+ character password and record it below)*
4. Advance to **Shared Folder Permissions**:
  - Find the LegalOS folder and check **Read/Write**.
5. Advance to **Applications**:
  - Find **WebDAV Server** and check **Allow**.
6. Click **Done** to save.

## Phase 7 Deployment Architecture

### Scenario A: Local Office Deployment (Server inside office)

If the LegalOS server runs on an office computer or local mini-server on the same Wi-Fi/LAN:

- **WebDAV URL:** http://<LOCAL\_NAS\_IP>:5005 (e.g. http://192.168.1.50:5005 )
- **Port Forwarding:** Not needed.

### Scenario B: Cloud VPS Deployment (Server on DigitalOcean / AWS / Hetzner)

If the LegalOS server is hosted on a cloud VPS, it must reach the office NAS over the internet:

### 1. Enable Free Synology DDNS:

- In DSM, go to **Control Panel** → **External Access** → **DDNS** → **Add**.
- Service Provider: **Synology** • Hostname: `[firmname].synology.me`
- Check *"Request Let's Encrypt SSL certificate"* and save.

### 2. Forward Port on Office Router:

- Log into the office router (e.g. `192.168.1.1` ).
- In Port Forwarding, forward external port `5006` (TCP) to internal NAS IP `5006` .

### 3. WebDAV URL: `https://[firmname].synology.me:5006`

## Phase 8 Live Handshake & Verification Test

1. Open **StillWorks LegalOS** on your laptop and log in as **Admin**.
2. Go to **Admin Settings** → **Storage**.
3. Enter:
  - **WebDAV URL:** `http://192.168.1.50:5005` (or `https://[firmname].synology.me:5006` )
  - **Username:** `legalos_svc`
  - **Password:** [Password created in Phase 6]
  - **Root folder:** `/LegalOS`
4. Click **"Test Connection"**. Confirm the green checkmark appears.
5. Click **"Save changes"**.
6. **Live Upload Test:** Upload any PDF under **Cases** or **Documents**. Open Synology **File Station**, navigate into `/LegalOS` , and verify the file is stored.

Record

Client Information & Handover Sheet

Complete this section on-site and save it securely in a password manager:

| Parameter                      | Recorded Client Value    |
|--------------------------------|--------------------------|
| Client / Law Firm Name         | -----                    |
| Synology Model                 | -----                    |
| NAS Local Static IP            | -----                    |
| External DDNS / Domain         | -----                    |
| Service Username               | legalos_svc              |
| Service Password               | -----                    |
| Root Shared Folder             | /LegalOS                 |
| WebDAV Port                    | HTTP: 5005 / HTTPS: 5006 |
| Office Router Admin IP & Login | -----                    |
| ISP / Connection Type          | -----                    |
| Date Configured                | -----                    |
| Engineer Name & Signature      | -----                    |
